ES6?

Standard ECMA-262
6th Edition / June 2015

ECMAScript[®] 2015 Language Specification

<http://www.ecma-international.org/ecma-262/6.0/>

Where can you use it?

- Browsers
 - Polyfills, <https://caniuse.com/>
- React with create-react-app ✓
- React without create-react-app
 - Check webpack config: es2015 or similar
- React Native ✓

What is different?

All the old stuff still works. New stuff is just added:

const, let

Arrow functions

Template literals

Destructuring assignment

Spread operator

Import/Export

Classes

Promises

Async/Await

Generators

var *vs* **const** *vs* **let**

Don't use **var**

Use **const** if the value won't change

Use **let** if the value will change

Arrow Functions

Change the way “**this**” is bound

Arrow Functions in React Components

addItem in TodoList.js

See where it's passed in as a prop to the button

With arrow function, don't need .bind in constructor

Defining in class more performant than arrow function directly on prop

Template Literals

Allows for newlines and string interpolation

Destructuring Assignment

Extract from objects and arrays

“Rest” Operator

`...rest`

Advanced destructuring assignment

Spread Operator

Opposite of ...rest

Creates new objects or arrays

Import / Export

Replaces “require”

Compatible with old libraries

Classes

JS is still not truly object oriented - it's prototype based

Promises

Avoid problems with callbacks

Async/Await

Even smoother asynchronous code

Generators

A generator is a function that can be paused

Yield control back to the caller
